TITLE: Investigation of the change in catalase activity in fucidine-resistant Staphylococcus aureus cultures

SOURCE: Academia scientiarum hungaricae. Acta microbiologica, v. 12, no. 3, 1965, 223-227

TOPIC TAGS: bacteriology, enzyme, biologic respiration

ABSTRACT: The catalase activity of the cells of Staphylococcus aureus cultures gradually ceases in the course of fucidine adaptation. There is no enzyme induction in the fucidine-fast cultures since the equilibrium of the processes is shifted toward catalase-independent oxidation mechanisms during the adaptation and, therefore, fucidine has no influence on the respiration rate of the microorganisms undergoing adaptation. "Study of the Respiration and of the Mechanism of Catalase Effect of Staphylococcus Aureus Cultures in the Course of Antibiotic Adaptation."

Budapest, Kiserletes Orvostudomany, Vol XVIII, No 5, Oct 66, pages 454-459.

Abstract: [Authors' Hungarian summary] In the course of adaptation to fucidin, the catalase activity of the Staph. aureus culture decreases greatly. The induction of catalase in the bacterial culture occurs at the time of great decrease in oxygen pressure, that is, at the time when the oxygen consumption of the cells is at its highest intensity. Because of its reducing properties, when ascorbic acid is added to the culture medium, it decreases suddenly the oxygen pressure of the culture and thus provides more rapidly the conditions for catalase induction. Since, in contrast to the peroxidase system, catalase is capable of insuring the oxidation process of the cells with lesser amounts of oxygen as well, its role is to insure the stationary phase of development. In the course of fucidin adaptation, there is a decrease in catalase activity which in turn results in the shortening of the stationary phase. 1 Hungarian, 13 Western references. "The Occurrence of Cryoglobulinemia Based on 9454 Examinations."

Budapest, Orvosi Hetilap, Vol 104, No 5, 3 Feb 63, pages 205-207.

Hungarian
Abstract: [Authors' summary modified] Serum was tested for cryoglobulinemia in 7954 diseased patients and 20 showed positive tests. Of 1500 healthy control subjects none showed positive results. Cryoglobulinemia occurs mainly in hematological diseases (5.48 per cent) although it is not extremely rare in mixed medical cases. Its use is recommended in screening tests to detect early stages of disease. [19 Western 6 Hungarian references]

Orig Pub : Magyar állatorv. lapja, 1957, 12, No 3, 65-66.

Abstract : An intramuscular CCl_4 injection in a dose of 6 ml/100 kg proved to be most successful. The preparation, mixed with an equal part of liquid paraffin, was injected into 4 different sites of the muscles of the neck. On the 2nd-3rd day following the injection, loss of appetite and, at times, diarrhea were observed in the animals. These symptoms rapidly disappeared, however. It is emphasized that on farms where the feed contains insufficient Ca amounts, $CaCO_3$ compounds should be given to the animals before

Title : The Therapeutic Action of Fulvoacid in Affection
of Liver in Animals.

Orig Pub: Magyar allatorv. Lapja, 1957, 12, No. 11, 351-352

Abstract: Fulvoacids (FA) belong to the group of humic acids; their chemical structure is almost unknown. It is known that they stimulate the growth of roots of plants and activate respiration. There is a great amount of FA in animal feces. Peat FA have successfully been used for some treatment of various diseases of the gastro-intestinal tract.

and liver in man. FA, introduced perorally (single dose 0.05-0.15 g, daily 0.25-0.5 g), promotes the improvement of appetite, termination of nausea, vomiting, regurgitation and meteorism, as well as intestinal and hepatic colic. FA promotes the normalization of the secretion of gastric juice; by its action diarrheas cease quickly. Considering the beneficial therapeutic effect of FA in various human diseases, experiments were conducted in order to find its suitableness in veterinary science. It was established that FA has no toxic effect. It was established by serologic investigations that the introduction of FA does not promote the formation of antibodies. It was shown in experiments on mice, intoxicated with CCl_4 (I), that FA protects the liver of animals against

the toxic effect of I to a considerable degree. This has practical significance, since in sheep and large cattle affection of the liver after intramuscular introduction of a mixture of I with paraffin oil is frequently observed. In poisoning with Agaricus bulbosus, the liver is particularly strongly affected. Experiments were conducted with mice (43) and rabbits (21) to which an extract of Agaricus bulbosus was introduced subcutaneously in various doses. After it, to one group of animals FA was introduced (subcutaneously and internally); to the other group, dimercaptopropanole was introduced intramuscularly; a third, the control group, was not subjected to treatment. All animals of the third group perished while, of the animals which received FA, only 50% perished. It was established by histologic investigation

that in these animals there are only insignificant changes of the liver, while in the rest of the animals severe destructivo-degenerative changes of the liver were discovered. - A. I. Ivanov

Budapest, Magyar Allatorvosok Lapja, Vol 6, No 18, June 63, pp 227-231.

Abstract: [Author's English summary modified] The toxicity of Distocain (equal parts of CCl_4 and paraffin oil, containing 0.5 per cent lidocaine base) has been tested on cows treated in the field 6-12 times over a 3-5 year period. Changes in the serum protein fractions, total serum bilirubin and liver function were investigated. After slaughter, the site of the injections, liver, endocrine glands, heart, kidney, ovary, uterus and the central nervous system were examined histologically. Changes in the protein fractions are considered reversible. No disturbances were found in liver function. Lesions characteristic of oil granuloma were found at the site of repeated injections retarding the absorption of the active substance. The histological tests showed no lesions attributable to the treatment, in the organs tested. On the average, 100,000 cattle are being treated yearly by this method. Milk and meat production increased and the number of liver rejections decreased as a result of the treatment. The use of Distocain in amounts of 10 ml/100 kg body weight is recommended with a maximal dosage of 50 ml for a single animal. 9 Western, 10 Eastern European references.

1012. CLINICAL EXPERIENCES IN 550 CASES OF FEMALE GENITAL TB -
Klinische Erfahrungen in 550 Fällen weiblicher Genitaltuberkulose -
Kovács F. and Gavallér I. Staatl. Hebammenlehranst., Budapest;
Univ. -Frauenklin., Debrecen - ZBL.GYNÄK. 1958, 80/26 (1000-1046)

Graphs 1 Tables 5

Between 1941 and 1956, 2.5 to 3% of all patients suffered from genital tb, the usual percentage being only 0.1 to 1.5. This high incidence is mainly attributed to the frequent diagnostic curettages of uterus, abscess wall and fistular canal, which are never contraindicated when acute or subacute phenomena are no longer present. Besides, examination of the menstrual blood is of value. Genital tb is important from the point of view of public health, because it is an open form of tb. In addition to spread of the infection to other people, there exists the danger of infection of the live stock by human tb. Out of 550 patients, 464 were married. Of these, 74.3% had primary and 18.3% secondary sterility. Abortion occurred in 5% and extra-uterine pregnancy in 1.9%. Pregnancy coinciding with genital tb causes a condition which is not without danger, especially if the disease remained unrecognized so that no correct treatment could be applied. Sterility is nearly always the first symptom. Of 579 sterile women, 17% had genital tb. Therefore, pre-marital examination must take into account this possibility. Drug treatment is to be preferred, using isoniazid, PAS and streptomycin, and should preferably be clinical. Surgery should be considered only if drug treatment has failed and severe symptoms make it necessary. Surgical treatment should be supported by chemotherapy; in most cases it will be necessary to remove the uterus and the tubes, but the ovaries can usually be spared, at least partially.

"Effect of Aromatic Hydrocarbons on the Frequency of Cerebrocortical Strychnine-Spike Bursts."

Budapest, Kiserletes Orvostudomany, Vol XVIII, No 4 Aug 66, pages 410-417.

Abstract: [Authors' Hungarian summary] The central nervous systemic effects of benzene and xylene were studied. The method involved observation of changes in the frequency of spike bursts evoked by the placement of strychnine on the exposed cerebral cortex. The data obtained suggest the possibility that, when administered acutely into the organism (in 0.7 ml/kg amounts), benzene and xylene also attack some point in the brain stem in addition to their cortical paralyzing effect. 6 Eastern European, 12 Western references. AUTHOR: Kovács, Ferenc

TITLE: High frequency properties and equivalent circuit of drift transistors

PERIODICAL: Híradástechnika, no. 1, 1962, 6 - 13

TEXT: The main factors limiting the high frequency amplification of junction transistors are the finite transit time in the base, the junction capacitances, and the base resistance. To increase the frequency working range, the base width may be reduced. However, a base width of a few μ presents technological difficulties and increases the possibility of a breakdown. An appreciable reduction in the transition time is achieved by creating a drift field by means of a suitable distribution of the impurities in the base. This field accelerates the minority carriers towards the collector. Starting from the basic equations for the distribution of the majority carrier density in the n-type base, an equation is derived for the distribution of impurities in the base to produce a uniform field. It is assumed that the doping is heavy and hence the number of donors is

Card 1/2

High frequency properties and ...

H/009/62/000/001/001/003
D286/D304

B

always much larger than the number of intrinsic electrons. Using a differential equation for the hole concentration in the base, equations are derived for the changes in the hole current due to changes in the emitter and collector potential. With the aid of the expressions derived for the hole currents, hole admittances, electron currents and electron admittances, an equivalent circuit is obtained. The theoretical value of the base emitter and base collector capacitances is given, assuming an abrupt change between p- and n-type materials. Finally the main characteristics of the diffusion and drift transistors are compared and it is shown that the application of a drift field increases the cut-off frequency, and also improves the low frequency properties of the transistor. There are 3 figures and 5 references: 1 Soviet-bloc and 4 non-Soviet-bloc. The references to the English-language publications read as follows: Moll and Ross, Proc. TITLE: Inhibition of phosphoglucomutase with anions, phosphate esters and Mg⁺⁺ ions

SOURCE: Kiserletes orvostudomany, v. 17, no. 3, 1965, 284-294

TOPIC TAGS: enzyme, magnesium, negative ion, organic phosphorus compound, animal physiology, biochemistry, cell physiology

ABSTRACT:

Phosphoglucomutase is inhibited more by MgSO₄ than by MgCl₂. The inhibition by Na₂SO₄ is also greater than by NaCl. The mutase inhibitory (m.i.) effect of anions (fluoride, chloride, sulfate, phosphate, pyrophosphate) cannot be decreased with Mg⁺⁺ ion. The m.i. effect of these anions is in competition with G-1,6-P₂, the coenzyme of mutase. The m.i. effect of NaF cannot be diminished with excess Mg⁺⁺ or with G-1-P; the inhibitory effect of the fluoride ion is also in competition with the G-1,6-P₂. The m.i. effect of phosphate esters (ADP, AMP, UDP, UDPG and 6-P-gluconic acid) is also competitive to G-1,6-P₂. The m.i. effect of ATP and UTP can be decreased by the addition of Mg⁺⁺ ion and can be completely suspended by the combined addition of G-1,6-P₂ and Mg⁺⁺ ion. The excess of Mg⁺⁺ ion brings about a mutase inhibition in competition with G-1,6-P₂.
